Underlying software:

# Why yet another math software?

Most computer algebra systems...

- are **non-free**
- have no full **internationalized** (localized) version
- have different and difficult **syntax** (even for teachers, not only for students!)
- start too slow (even on recent machines)
- have big **memory demand** (for parallely run other software as well)
- react to user questions sometimes **slow** (depending on the running machine)

Number theory logo © Zoltan Medve

Underlying software:

# By contrast...

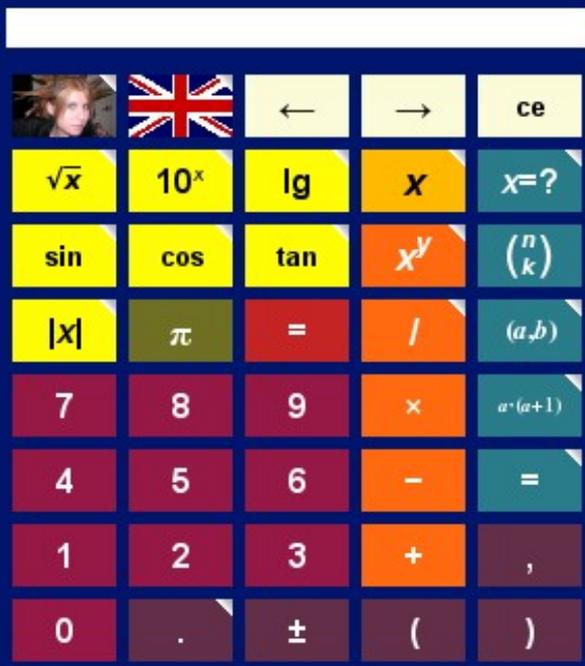

## WMI2...

- is **free** and using **free modules** (Maxima, gnuplot, LaTeX, PostgreSQL, PHP, Apache, Linux)
- offers open standards for complete **localization**
- uses a common, **easy syntax** (which can be described in not more than 10 sentences)
- on broadband internet connection it starts always **very fast** (independently of the machine)
- has very **low memory** demand on client machines
- on broadband internet connection it reacts very fast

Underlying software:

# What is WMI2 exactly?

A graphical user interface for the *Maxima CAS* and the *gnuplot function plotter* (and other backends) and...

- focuses on **calculator-like functions** (>70 actions)
- saves calculations on a **worksheet**
- offers an **intuitive web interface** on-line 7/24
- has an automatic **formula syntax corrector** and converter
- defines 6 different **layouts** for different groups of students (school types and object categories)
- is available in **10 languages** (English, German, French\*, Italian, Chinese\*\*, Czech, Slovak, Serbian and Hungarian)

Underlying software:

# How does WMI2 work?

- The server software is installed on a **remote server** machine (or more machines, using load balancing)
- The user on the client side downloads a minimal **HTML/Javascript** code for interaction to the server
- All computations and formula generation are done on server side
- Only displaying formulas and graphs (both as images) are done by the **browser** on client side
- The server side is **caching** all queries (both questions and answers) to efficiently serve classroom usage

Underlying software:

# What's new in 2.1.6?

## And why?

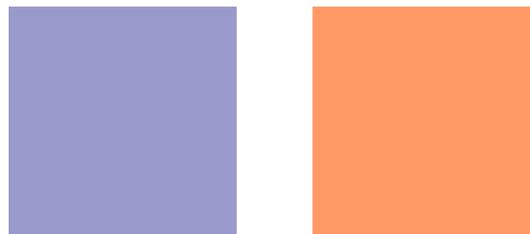

## Intuitivity

### Shortage of demo examples

- Mediawiki site
- API by allowing URL parameters

### Ease of use

- enhanced mouse accessibility for slow users
- confirmation on user requested page closing
- easy export to other systems (images, formulas)
